

"The book 'Discoveries in Photosynthesis', edited by Govindjee, J. Thomas Beatty, Howard Gest and John F. Allen, is a remarkable Encyclopedia of Research in Photosynthesis, its discoveries, and its difficulties during the last century. Biologists, biochemists, physicists and molecular biologists were involved with their successes, as well as their failures, in putting together today's overall picture of this uniquely important physiological process, on which life on this planet depends. This book should not be missed by anyone interested in photosynthesis: It is a must for all libraries around the world."

Giorgio Forti
Professor of Biology
University of Milano, Italy
